B4LENGTH	Class	Constant containing the number of bytes for a full Binary4 packet	16	int		
B4BINARYLENGTH	Class	Constant containing the number of bytes for binary data in a Binary4 packet	8	int		
_preampGain	Instance	Preamplifier gain	10 or 100	int		
Methods						
Name	Туре	Description	Parameter Name	Parameter Purpose	Return	Exception
		Runs when an instance is constructed. It runs the	port: str int	String of the serial port to be opened. Used when initializing the COM_io instance.		
init	Dunder	parent's initialization. Then it updates the _commands to contain the appropriate commands for an 8306HR	preampGain: int	Preamplifier gain. Must be 10 or 100.	N/A	N/A
		POD device.	baudrate:int=9600	Integer baud rate of the opened serial port. Used when initializing the COM_io instance.		
UnpackPODpacket_Binary	Static	Overwrites the parent's method. Separates the components of a binary4 packet into a dictionary.	msg: bytes	Bytes string containing a complete binary4 Pod packet: STX (1 byte) + command (4 bytes) + packet number (1 bytes) + TTL (1 byte) + ch0 (2 bytes) + ch1 (2 bytes) + ch2 (2 bytes) + checksum (2 bytes) + ETX (1 byte)	A dictionary containing 'Command Number', 'Packet #', 'TTL', 'Ch0', 'Ch1', and 'Ch2' in bytes.	An exception is raised if (1) the packet does not have the minimum number of bytes, (2) does not begin with STX, or (3) does not end with ETX.
TranslatePODpacket_Binary	Static	Overwrites the parent's method. Unpacks the binary4 POD packet and converts the values of the ASCII-encoded bytes into integer values and the values of binary-encoded bytes into integers. Channel values are given in Volts.	msg: bytes	Bytes string containing a complete binary4 Pod packet: STX (1 byte) + command (4 bytes) + packet number (1 bytes) + TTL (1 byte) + ch0 (2 bytes) + ch1 (2 bytes) + ch2 (2 bytes) + checksum (2 bytes) + ETX (1 byte)	A dictionary containing 'Command Number', 'Packet #', 'TTL', 'Ch0', 'Ch1', and 'Ch2' as numbers.	N/A
TranslatePODpacket	Instance	Overwrites the parent's method. Determines if the packet is standard or binary, and translates accordingly. Adds a check for the 'GET TTL PORT' command.	msg: bytes	Bytes string containing either a standard or binary packet	A dictionary containing the unpacked message in numbers	N/A
_TranslateTTLbyte_ASCII	Static	Separates the bits of each TTL (0-3) from a byte.	ttlByte: bytes	One Byte string for the TTL (ASCII encoded)	Dictionary of the TTLs. 1 when input, 0 when output.	N/A
_TranslateTTLbyte_Binary	Static	Separates the bits of each TTL (0-3) from a byte.	ttlByte: bytes	One Byte string for the TTL (binary encoded)	Dictionary of the TTLs. 1 when input, 0 when output.	N/A
_BinaryBytesToVoltage	Instance	Converts a binary bytes value read from POD device and converts it to the real voltage value at the preamplifier input	value: bytes	Bytes string containing voltage measurement	A number containing the voltage in Volts [V].	N/A
_Read_Binary	Instance	After receiving the prePacket, it reads the 8 bytes(TTL+channels) and then reads to ETX	prePacket: bytes	Bytes string containing the beginning of a POD packet: STX (1 byte) + command number (4 bytes)	Byte string for a binary4 POD packet.	N/A
_iveau_bilidiy	nistance	(checksum+ETX).	validateChecksum:bool=Tr ue	Set to True to validate the checksum. Set to False to skip validation	byte suring for a billary4 FOD packet.	IVA

Class						
Name	File	Description	Parent	Child	Author	
POD_Packets	PodPacket Handling.py	Collection of methods for creating and interpreting	N/A	N/A	Thresa Kelly	
Imports						
Name	Origin	Description	From			
N/A	N/A	N/A	N/A			
Methods						
Name	Туре	Description	Parameter Name	Parameter Purpose	Return	Exception
STX	Static	Get STX in bytes. STX marks the starting byte of a POD Packet	N/A	N/A	Bytes for STX (0x02)	N/A
ETX	Static	Get ETXin bytes. ETX marks the end byte of a POD Packet	N/A	N/A	Bytes for ETX(0x03)	N/A
IntToAsciiBytes	Static	Converts an integer value into ASCII-encoded bytes. First, it converts the integer value into a usable uppercase hexadecimal string. Then it converts the ASCII code for each character into bytes. Lastly, it ensures that the final message is the desired length.	value: int	Integer value to be converted into ASCII-encoded bytes	Bytes that are ASCII-encoded conversions of the value parameter.	N/A
		Example: if value=2 and numBytes=4, the returned ASCII will show b'0002', which is '0x30 0x30 0x30 0x32' in bytes.	numBytes: int	Number bytes to be the length of the ASCII-encoded message.		
AsciiBytesToInt	Static	Converts a ASCII-encoded bytes message into an integer. It does this using a base-16 conversion.	msg_b: bytes	Bytes message to be converted to an integer. The bytes must be base-16 or the conversion will fail.	Integer result from the ASCII-encoded byte conversion.	N/A
		Converts binary-encoded bytes into an integer	msg: bytes	Bytes message holding binary information to be converted into an integer.	Integer result from the binary-encoded bytes message.	N/A
BinaryBytesToInt	Static		byteorder:str='big'	Ordering of bytes. 'big' for big endian and 'little' for little endian.		
			signed:bool=False	Boolean flag to mark if the msg is signed (True) or unsigned (False)		
ASCIIbytesToInt_Split	Static	Converts a specific bit range in an ASCII-encoded bytes object to an integer.	msg: bytes	Bytes message holding binary information to be converted into an integer.	Integer result from the ASCII-encoded bytes message in a given bit range.	N/A
ASCIIDYLES TOITIL_SPIIL	Static		keepTopBits: int	Integer position of the msb of desired bit range		
			cutBottomBits: int	Integer number of lsb to remove		
			msg: bytes	Bytes message holding binary information to be converted into an integer.		
			keepTopBits: int	Integer position of the msb of desired bit range		
BinaryBytesToInt_Split	Static	Converts a specific bit range in a binary-encoded	cutBottomBits: int	Integer number of lsb to remove	Integer result from the binary-encoded bytes message	N/Δ
	o.a.ao	bytes object to an integer	byteorder:str='big'	Ordering of bytes. 'big' for big endian and 'little' for little endian.	in a given bit range.	
			signed:bool=False	Boolean flag to mark if the msg is signed (True) or unsigned (False)		
Checksum		Calculates the checksum of a given bytes message. This is achieved by summing each byte in the message, inverting, and taking the last byte.	bytesIn: bytes	Bytes message containing POD packet data	Two ASCII-encoded bytes containing the checksum for bytesIn	N/A
BuildPODpacket_Standard		Builds a standard POD packet STX (1 byte) + command number (4 bytes) + optional packet (? bytes) + checksum (2 bytes) + ETX (1 bytes) as	commandNumber: int	Integer representing the command number. This will be converted into a 4 byte long ASCII-encoded bytes string.		N/A
		bytes.	payload:bytes None= None	bytes string containing the payload		
PayloadToBytes	Static	Converts a payload into a bytes string	payload: int bytes tuple[int byte s]	Integer, bytes, or tuple containing the payload	Bytes string of the payload	Raises an Exception when the payload argument is an incorrect type or formatted incorrectly.
			argSizes: tuple[int]	Tuple of the argument sizes

Variables						
Name	Scope	Description	Value	Туре		
numPod	Class	Integer equal to the number of POD_Basics class instances. Incremented on construction and decremented on destruction	0	int		
MINSTANDARDLENGTH	Class	integer minimum number of bytes in a standard POD packet	8	int		
MINBINARYLENGTH	Class	integer minimum number of bytes in a binary POD packet	15	int		
_port	Instance	Open serial port via COM_io class instance	COM_io	COM_io		
_commands	Instance	Command handler POD_Commands class instance	POD_Commands	POD_Commands		
Methods						
Name	Туре	Description	Parameter Name	Parameter Purpose	Return	Exception
init	Dunder	Runs when an instance of POD_Basics is constructed. It initializes the instance variable for the COM port communication (_port) and for the command handler (_commands). It also increments	port: str int	String of the serial port to be opened. Used when initializing the COM_io instance. Integer baud rate of the opened serial port. Used	N/A	N/A
		the POD device counter (NUMPOD).	baudrate:int=9600	when initializing the COM_io instance.		
del	Dunder	Runs when an instance is destructed. It decrements the POD device counter (NUMPOD)	N/A	N/A	N/A	N/A
GetNumberOfPODDevices	Static	Get the POD device counter	N/A	N/A	Integer of the number of class instances (NUMPOD).	N/A
UnpackPODpacket_Standard	Static	Converts a standard POD packet into a dictionary containing the command number and payload (if applicable) in bytes.	msg: bytes	Bytes message containing a standard POD packet: STX (1 byte) + command number (4 bytes) + optional packet (? bytes) + checksum (2 bytes) + ETX (1 bytes)	A dictionary containing the POD packet's 'Command Number' and 'Payload' (if applicable) in bytes.	An exception is raised if (1) the msg does not have the minimum number of bytes in a standard pod packet, (2) does not begin with STX, and (3) does not end with ETX.
UnpackPODpacket_Binary	Static	Converts a variable-length binary packet into a dictionary containing the command number, binary packet length, and binary data in bytes.	msg: bytes	Bytes message containing a variable-length POD packet: STX (1 byte) + command number (4 bytes) + length of binary (4 bytes) + checksum (2 bytes) + ETX (1 bytes) + binary (LENGTH bytes) + checksum (2 bytes) + ETX (1 bytes)	A dictionary containing the 'Command Number', 'Binary Packet Length', and 'Binary Data' in bytes.	An exception is raised if (1) the msg does not have the minimum number of bytes in a standard pod packet, (2) does not begin with STX, (3) does not end with ETX, and (4) does not have an ETX after standard packet.
TranslatePODpacket_Standard	Instance	Unpacks the standard POD packet and converts the ASCII-encoded bytes values into integer values.	msg: bytes	Bytes message containing a standard POD packet	A dictionary containing the POD packet's 'Command Number' and 'Payload' (if applicable) in integers.	N/A
TranslatePODpacket_Binary	Static	Unpacks the variable-length binary POD packet and converts the values of the ASCII-encoded bytes into integer values and leaves the binary-encoded bytes as is.	msg: bytes	Bytes message containing a variable-length POD packet	A dictionary containing the 'Command Number' and 'Binary Packet Length' in integers, and 'Binary Data' in bytes.	N/A
_ValidateChecksum	Static	Validates the checksum of a given POD packet. The checksum is valid if the calculated checksum from the data matches the checksum written in the packet.	msg: bytes	Bytes message containing a POD packet: STX (1 bytes) + data (? bytes) + checksum (2 bytes) + ETX (1 byte).	Returns True if the checksum is correct, false otherwise.	An exception is raised if the msg does not begin with STX or end with ETX.
GetDeviceCommands	Instance	Gets the dictionary containing the class instance's available POD commands.	N/A	N/A	Dictionary containing the available commands and their information. Formatted as key(command number): value([command name, number of argument ASCII bytes, number of return bytes, binary flag])	N/A
SetBaudrateOfDevice	Instance	If the port is open, it will change the baud rate to the parameter's value	baudrate: int	Integer baud rate to set for the open serial port.	True if successful at setting the baud rate, false otherwise	N/A
UnpackPODpacket	Static	Determines if the packet is standard or binary, and unpacks accordingly.	msg: bytes	Bytes string containing either a standard or binary packet	A dictionary containing the unpacked message in bytes	N/A
TranslatePODpacket	Instance	Determines if the packet is standard or binary, and translates accordingly.	msg: bytes	Bytes string containing either a standard or binary packet	A dictionary containing the unpacked message in numbers	N/A
			cmd: str int	An integer representing the command number.		
WriteRead	Instance	Writes a command with optional payload to POD device, then reads (once) the device response.	payload:int bytes tuple[int bytes]=None	set to an integer value or a bytes string.	Bytes string containing a POD packet beginning with STX and ending with ETX. This may be a standard packet, binary packet, or an unformatted packet	N/A
			validateChecksum:bool= True	Set to True to validate the checksum. Set to False to skip validation	(STX+something+ETX).	
		Ruilds a POD nacket and writes it to a POD device via	cmd: str int	An integer representing the command number.		An exception is raised if (1) the command does not

GetPODpacket	Instance	COM port. If an integer payload is give, the method will convert it into a bytes string of the length expected by the command. If a bytes payload is given, it must be the correct length.	payload:int bytes tuple[int bytes]=None	None when there is no payload. If there is a payload, set to an integer value, bytes string, or tuple	Returns the bytes string of the POD packet.	exist for the instance, (2) a payload is not given when the command expects one, (3) the payload (given in bytes) is the size not expected by the command, or (4) the payload is given as a type other than integer or bytes.
WritePacket	Instance	Builds a POD packet and writes it to the POD device.	cmd: str int	An integer representing the command number.	Returns the bytes string that was written to the POD	N/A
Wilter acket	mstarice	builds a 1 OD packet and writes it to the 1 OD device.	payload:int bytes tuple[int bytes]=None	None when there is no payload. If there is a payload, set to an integer value, bytes string, or tuple	device	IVA
ReadPODpacket	Instance	Reads a complete POD packet, either in standard or binary format, beginning with STX and ending with ETX. Reads first STX and then starts recursion.	validateChecksum:bool= True	Set to True to validate the checksum. Set to False to skip validation	Bytes string containing a POD packet beginning with STX and ending with ETX. This may be a standard packet, binary packet, or an unformatted packet (STX+something+ETX).	N/A
_ReadPODpacket_Recursive	Instance	Reads the command number. If the command number ends in ETX, the packet is returned. Next, it checks if the command is allowed. Then, it checks if the command is standard or binary and reads accordingly, then returns the packet.	validateChecksum:bool= True	Set to True to validate the checksum. Set to False to skip validation	Bytes string containing a POD packet beginning with STX and ending with ETX. This may be a standard packet, binary packet, or an unformatted packet (STX+something+ETX).	N/A
_Read_GetCommand	Instance	Reads one byte at a time up to 4 bytes to get the ASCII-encoded bytes command number. For each byte read, it can (1) start the recursion over if an STX is found, (2) returns if ETX is found, or (3) continue building the command number.	validateChecksum:bool= True	Set to True to validate the checksum. Set to False to skip validation	4 byte long string containing the ASCII-encoded command number.	An exception is raised if the command number is not allowed for the POD device
_Read_ToETX	Instance	Reads one byte at a time until an ETX is found. It will restart the recursive read if an STX is found anywhere.	validateChecksum:bool= True	Set to True to validate the checksum. Set to False to skip validation	Bytes string ending with ETX	N/A
Read Standard	Instance	Reads the payload, checksum, and ETX. Then it	prePacket: bytes	Bytes string containing the beginning of a POD packet: STX (1 byte) + command number (4 bytes)	Bytes string for a complete standard POD packet	An exception is raised if the checksum is invalid (only
_Read_Standard	instance	builds the complete standard POD packet in bytes.	validateChecksum:bool= True	Set to True to validate the checksum. Set to False to skip validation	bytes string for a complete standard POD packet	if validateChecksum=True)
_Read_Binary	Instance	Reads the remaining part of the variable-length binary packet. It first reads the standard packet (prePacket+payload+checksum+ETX). Then it determines how long the binary packet is from the payload of the standard POD packet and reads that many bytes. It then reads to ETX to get the checksum+ETX.	prePacket: bytes	Bytes string containing the beginning of a POD packet: STX (1 byte) + command number (4 bytes)	Bytes string for a variable-length binary POD packet	An exception is raised if the checksum is invalid (only if validateChecksum=True)
	Instance		validateChecksum:bool= True	Set to True to validate the checksum. Set to False to skip validation

_ARGUMENTS Class index key for the number of bytes in an argument forcommands list values 1 int	
RETURNS Class Index key for the number of bytes in the return for commands list values commands list values 2 int	
BINARY Class index key for the binary flag forcommands list values 3 int	
NOVALUE Class Integer used to mark when a list item incommands means 'no value' or undefined1 int	
_U8 Class Number of bytes for an unsigned 8-bit value 2 int	
_U16 Class Number of bytes for an unsigned 16-bit value 4 int	
Dictionary containing the available commands for a POD device. Each entry is formatted as { key(command number): value([command name, number of argument ASCII bytes, number of return bytes, binary flag) } POD_Commands.Get BasicCommands() dict[int,list[str tuple[int] bool]]	
Methods	
Name Type Description Parameter Name Parameter Purpose Return Except	cception
init Dunder Runs whan an instance is constructed. It sents the commands dictionary to the basic command set. N/A N/A N/A N/A N/A N/A	'A
NoValue Static Gets value of _NOVALUE N/A N/A Value of _NOVALUE N/A	'A
U8 Static Gets value of _U8 N/A N/A Value of _U8 N/A	'A
U16 Static Gets value of _U16 N/A N/A Value of _U16 N/A	'A
GetBasicCommands Static Creates a dictionary containing the basic POD command set (0,1,2,3,4,5,6,7,8,9,10,11,12) N/A N/A N/A	'A
GetCommands Instance Gets the contents of the current command dictionary (_commands) N/A N/A N/A N/A N/A N/A N/A	Ά
RestoreBasicCommands Instance Sets the current commands (_commands) to the basic POD command set. N/A	'A
commandNumber: int Integer of the command number	
commandName: str String of the command's name	
AddCommand Instance Adds a command entry to the current commands dictionary (_commands) if the command does not tuple[int] Integer of the number of bytes in the argument the command could not be added because t already N/A	'A
exist returnBytes: tuple[int] Integer of the number of bytes in the return exists.	
isBinary: bool Boolean flag to mark if the command is binary (True) or standard (False)	
RemoveCommand Instance Removes the entry for a given command incommands dictionary. cmd: int str integer command number or string command name. True if the command was successfully removed, False if the command does not exist.	Α
CommandNumberFromName Instance Gets the command number from the command dumber. If the dictionary using the command's name name: str string of the command's name Integer representing the command number. If the command could not be found, return None.	'A
ArgumentBytes Instance Gets the tuple for the number of bytes in the argument for a given command. Gets the tuple for the number of bytes in the argument for a given command. Integer command number or string command name. Tuple representing the number of bytes in the argument for cmd. If the command could not be found, N/A return None.	'A
ReturnBytes Instance Gets the tuple for the number of bytes in the return for a given command. Gets the tuple for the number of bytes in the return for cmd: int str integer command number or string command name. Tuple representing the number of bytes in the return for cmd. If the command could not be found, return None.	'A
Instance Gets the binary flag for a given command could not be found, N/A integer command number or string command name. Boolean flag that is True if the command is binary and integer command number or string command name. False if standard. If the command could not be found, N/A return None.	'A
DoesCommandExist Instance Checks if a command exists in thecommands dictionary cmd: int str integer command number or string command name. True if the command exists, false otherwise. N/A	'A

Class						
Name	File	Description	Parent	Child	Author	
COM_io	SerialCommu nication.py	Handle serial communication (read/write) using COM ports.	N/A	N/A	Thresa Kelly	
Imports						
Name	Origin	Description	From			
serial.tools.list_ports	Enviornment	For accessing the COM ports on the computer	N/A			
Variables						
Name	Scope	Description	Value	Туре		
serialInst	Instance	Serial object to set the port and baud rate to. It can be opened or closed.	Serial	serial.Serial		
Methods						
Name	Туре	Description	Parameter Name	Parameter Purpose	Return	Exception
GetCOMportsList	Static	Finds all the available COM ports on the user's computer and appends them to an accessible list.	N/A	N/A	List containing the names of available COM ports	N/A
1-14	Dunder	Runs when the object is constructed. It initialized the	port: str int	String of the serial port to be opened.	N/A	N/A
init	Dunder	serialInst to a given COM port with a set baudrate.	baudrate:int=9600	Integer baud rate of the opened serial port.	N/A	N/A
del	Dunder	Runs when the object is destructed. It closes the serial port, if open.	N/A	N/A	N/A	N/A
BuildPortName	Instance	Converts the port parameter into the "COM"+ <number> format</number>	port: str int	Name of a COM port. Can be an integer or string.	N/A	N/A
IsSerialOpen	Instance	Returns True if the serial instance port is open, false otherwise	N/A	N/A	N/A	N/A
IsSerialClosed	Instance	Returns False if the serial instance port is open, True otherwise	N/A	N/A	N/A	N/A
CloseSerialPort	Instance	Closes the instance serial port if it is open.	N/A	N/A	N/A	N/A
OpenSorialPort	Instance	First, it closes the serial port if it is open. Then, it	port: str int	String of the serial port to be opened.	N/A	Raises an exception if the given port does not exist.
OpenSerialPort	mstance	opens a serial port with a set baud rate.	baudrate:int=9600	Integer baud rate of the opened serial port.	IN/A	raises an exception if the given port does not exist.
SetBaudrate	Instance	If the port is open, it will change the baud rate to the parameter's value	baudrate: int	Integer baud rate to set for the open serial port.	True if successful at setting the baud rate, false otherwise	N/A
GetPortName	Instance	Gets the name of the open port.	N/A	N/A	If the serial port is open, it will return a string of the port's name. If the port is closed, it will return None.	N/A
Read	Instance	Reads a specified number of bytes from the open serial port.	numBytes: int	Integer number of bytes to read	If the serial port is open, it will return a set number of read bytes. If it is closed, it will return None.	N/A
ReadLine	Instance	Reads until a new line ('\n') from the open serial port.	N/A	N/A	If the serial port is open, it will return a complete read line. If closed, it will return None.	N/A
ReadUntil	Instance	Reads until a set character from the open serial port.	eol: bytes	end-of-line character	If the serial port is open, it will return a read line ending in eol. If closed, it will return None.	N/A
Write	Instance	Write a set message to the open serial port.	message: bytes	byte string containing the message to write	N/A	N/A
